1. Scanner Basic Characteristics

1.1 Output Setting Content

Setting code content (such as "WFFD980") can be allowed to output. Scanning "Code Programming output content" and setting up successfully, the setting code content will be output to the host when reading setting code. When the "Code Programming output content" is enabled, setting code only as an ordinary bar code can not be used to set the Scanning Engine. When reading engine re-power, it will be return to default setting---Code programming not output content, at this time the setting code can be used to set the scanner engine

Code Programming output content

Default setting

1.2 Default Setting

Note: Please use the "Factory Default" function cautiously.

After scanning "Factory Default", scanning engine will lose the current parameter settings, instead of it is factory default parameters .

The factory default parameters and functions can be found in Appendix A

1.3 Communication Interface

1.3.1 Serial communication interface

Engine provide TTL-232 serial communication interface and USB interface to communicate with the host connection. Through the communication interface, it can receive reading data, control the instruction from the recognition engine, and modify the recognition engine function parameters. The recognition engine parameters can be modified through the reading setting code, but o

1.3.1.1 Baud Rate

Baud Rate's unit is bit/s, The optional configuration parameters are as below:

Parameters	Default
Serial Communication Type	Standard TTL-232
Baud Rate	9600
Check	None
Data bits	8
Stop bit	1
Hardware Flow Control	None

9600

WFFD9D3

1200

WFFD9D0

19200

WFFD9D5

2400

WFFD9D1

38400

WFFD9D6

1.3.2 USB Interface

When reading engine connects to the host by USB cable, the system will use USB DATAPIPE MODE automatically.

1.3.2.1 USB DATAPIPE

DATAPIPE USB is a custom USB transport protocol. This feature requires the installation of the corresponding driver on the host.

Switch to USB DATAPIPE Mode

1.3.2.2 USB HID-KBW

When using the USB interface, you can simulate the engine to read HID-KBW equipment. In this mode, reading engine will become a virtual keyboard output data to the host.

Switch to USB HID-KBW Mode

1.3.2.3 Standard Keyboard Input Mode

Standard keyboard input mode is the factory default setting. EM2000 reading engine provides another two input modes: Keyboard simulation input character mode and emulation input control character mode. It can be set according to the users' needs.

Switch to Standard keyboard input mode

W066000

1.3.2.4 Keyboard simulation input character mode

In order to input any ASCII character (16 hexadecimal value from 0x00 ~ 0xFF) in any kind of language, the virtual Keyboard can be set as Keyboard simulation input character mode. When using this combination of characters output, because of the large output data, the speed will slow down.

After switching to “Keyboard simulation input character mode”, input the data corresponding ASCII character, the scanner will read the code with virtual keyboard as below:

- (1) Keep pressing the “ALT”
- (2) According to the character code, input the number keys in the digital keyboard in turns.
- (3) Release “ALT”

Switch to Keyboard Simulation Input Character Mode

W066004

Note: It is recommended that you turn Num Lock on the main numeric keypad when Enabling this mode.

1.3.2.5 Emulation Input Control Character Mode

The HEX from 0x00~0x1F of ASCII values could be matched to some control function keys, In emulation keyboard, the control function keys input as bellows:

(1) Keep pressing “Ctrl”

(2) Press the pointed control keys (the specific ASCII values match the keys details see below table<Emulation keyboard Input Control Characters Pairing Table>)

(3) Release the “Ctrl” and control keys

Switch to Emulation Input Control Character Mode

W066002

1.3.2.6 Emulation keyboard Input Control Characters Pairing Table

ASCII Value (HEX)	Function Key	ASCII Value (HEX)	Function Key
00	2	10	P
01	A	11	Q
02	B	12	R
03	C	13	S
04	D	14	T

05	E	15	U
06	F	16	V
07	G	17	W
08	H	18	X
09	I	19	Y
0A	J	1A	Z
0B	K	1B	[
0C	L	1C	\
0D	M	1D]
0E	N	1E	6
0F	O	1F	.

1.3.2.7 Countries/Languages Keyboard Options

The language of different countries corresponding to the keyboard layout, symbols are not the same. According to the actual needs, Recognition engine can switch to different countries' keyboard system. The default is set to the first system---US English

1.US English

WFF6B16

1.3.2.8 Unknown Characters Beep

Due to the existence of language differences in the keyboard, some characters which appears in the bar code but not shown in the current emulation keyboard system and cannot be sent. Through the following setting to decide whether the reading engine send an error tone or not.

If you scan “no-warning”, there is no warning tone when the error happens. If you scan “warning”, there will be a warning tone when the barcode includes unknown characters.

1.3.2.9 Press Key Interval Delay Setting

Press key interval is the time between release the key and press the key.

1.3.2.10 Caps Lock

When Scanning “Turn on Caps Lock”, reading engine will convert the lower-case and capitals in the barcode information same as the open state of Caps Lock on the host keyboard.

Note: When use the “Keyboard simulation input character mode” or “Uppercase and Lowercase Enforce Transformation”, this function is not valid.

For example: Turn on this function, reading engine reads the data for the "AbC" code, but host will receive "aBc".

1.3.2.11 Uppercase and Lowercase Enforce Transformation

If scan “All Turn to Uppercase”, no matter the letters in the barcode is capitals or lowercase, all the letters change to capitals.

If scan “All Turn to Lowercase”, no matter the letters in the barcode is capitals or lowercase, all the letters change to lowercase.

For example: After scanning “All Turn to Lowercase” ,the reading information is “AbC”, the host will receive “abc”.

1.3.2.12 Emulation Number Mini Keyboard

Turn off this function, all output data is as big keyboard corresponding keys.

Turn on this function, when Num Lock is turned on, the scanner decoded number is from “0-9”,the output data is as emulation number mini keyboard corresponding keys. If the scanner decoded number is excluded from “0-9”, and including the characters of “+” “_” “*” “/” “.”, the output data is as big keyboard corresponding keys. When Num Lock is turned off, all output data is as big keyboard corresponding keys. When Num Lock is turned on, all output data is as emulation number mini keyboard corresponding keys.

Note: Please confirm “Num Lock” turns on when you use this function.

1.3.2.13 USB COM Port Emulation

If you connect the engine to the Host via a USB connection, the USB COM Port Emulation feature allows the Host to receive data in the way as a serial port does. However, you need to set communication parameters on the engine to match the Host requirements. A driver is required for this feature.

USB COM Port Emulation

1.3.2.14 HID-POS

The HID-POS interface is recommended for new application programs. It can send up to 56 characters in a single USB report and appears more efficient than USB HID-KBW.

Features:

- 1) HID based, no custom driver required.
- 2) Way more efficient in communication than USB HID-KBW and traditional RS-232 interface.

Note: HID-POS does not require a custom driver. However, a HID interface on Windows 98 does. All HID interfaces employ standard driver provided by the operating system. Use defaults when installing the driver.

HID-POS

2. Scan Mode

2.1 Manual Mode

Manual Mode (default): A trigger pull activates a decode session. The decode session continues until the barcode is decoded or the trigger is released .

2.2 Continuous Mode

Continuous Mode: The engine automatically activates a decode session. The decode session continues until the barcode is decoded or the decode session timeout expires. When a decode session is completed, the engine waits until the timeout between decodes expires and then starts next session. The engine continues to work in this pattern if the following situation does not happen: no barcode is presented to the engine or passed in front of it in a decode session, the engine will automatically suspend barcode reading. Pressing the trigger can suspend/resume barcode reading.

2.2.1 Decode Session Timeout

This parameter sets the maximum time decode session continues during a scan attempt. It is programmable in 0.1s increments from 0.1s to 25.5s. The default timeout is 5.0s. If the parameter is set to 0, the engine scans and decodes barcode

continuously. To learn how to program this parameter, see Appendix D: Parameter Programming Examples.

Decode Session Timeout

M00031D

2.2.2 Timeout between Decodes

This parameter sets the timeout between decode sessions. When a decode session ends, next session will not happen until the timeout between decodes expires. It is programmable in 0.1s increments from 0.1s to 25.5s. The default timeout is 1.0s. To learn how to program this parameter, see Appendix D: Parameter Programming Examples

Timeout between Decodes

M00031C

2.3 Sense Mode

Sense Mode: The engine waits for the image stabilization timeout to expire before activating a decode session every time it detects a change in ambient illumination. Decode session continues until the barcode is decoded or the decode session timeout expires. After a decode session ends, the engine waits for the timeout between decodes to expire before beginning to monitor ambient illumination. If no barcode is presented to the engine or passed in front of it in a decode session, the engine will automatically suspend barcode reading and start to monitor ambient illumination.

In the Sense mode, a trigger pull can also activate a decode session. The decode session continues until the barcode is decoded or the trigger is released. When the session ends, the engine will continue to monitor ambient illumination.

2.3.1 Decode Session Timeout

This parameter sets the maximum time decode session continues during a scan attempt. It is programmable in 0.1s increments from 0.1s to 25.5s. The default timeout is 5.0s. If the parameter is set to 0, the engine scans and decodes barcode continuously. To learn how to program this parameter, see Appendix D: Parameter Programming Examples.

2.3.2 Timeout between Decodes

After a decode session ends, the engine waits for the timeout between decodes to expire before beginning to monitor ambient illumination. This parameter is programmable in 0.1s increments from 0.1s to 25.5s. The default timeout is 1.0s. To learn how to program this parameter, see AppendixD Parameter Programming Examples

Timeout between Decodes

2.3.3 Image Stabilization Timeout

The engine waits for the image stabilization timeout to expire before activating a decode session every time it detects a change in ambient illumination. This parameter is programmable in 0.1s increments from 0.1s to 25.5s. The default timeout is 0.4s. To learn how to program this parameter, see Appendix D: Parameter Programming Examples

Image Stabilization Timeout

2.3.4 Sensitivity

Sensitivity specifies the degree of acuteness of the engine's response to changes in ambient illumination. The higher the sensitivity, the lower requirement in illumination change to trigger the engine. You can select an appropriate degree of sensitivity that fits the ambient environment. The default setting is Medium Sensitivity.

High Sensitivity

Medium Sensitivity

Low Sensitivity

Custom Sensitivity

Sensitivity levels range from 0 to 255. The smaller the number, the higher the sensitivity.

Users can select a desired sensitivity level that helps achieve greater efficiency. To learn how to program this parameter, see AppendixD: Parameter Programming Examples

2.4 Command Trigger Mode

Command Trigger Mode: Decode session is activated by a host command (i.e. set the bit0 of register 0x0002 to “1”). The decode session continues until the barcode is decoded or the decode session timeout expires.

Command Trigger Mode

W030001

2.4.1 Decode Session Timeout

This parameter sets the maximum time decode session continues during a scan attempt. It is programmable in 0.1s increments from 0.1s to 25.5s. The default timeout is 5.0s. If the parameter is set to 0, the engine scans and decodes barcode continuously. To learn how to program this parameter, see Appendix D: Parameter Programming Examples.

Decode Session Timeout

M00031D

3. Illumination & Aiming

3.1 Illumination

A couple of illumination options are provided to improve the lighting conditions during every image capture:

Normal (default): Illumination LED is turned on during image capture.

Always ON: Illumination LED keeps ON after the engine is powered on.

OFF: Illumination LED is OFF all the time.

3.2 Aiming

When scanning/capturing image, the engine projects an aiming beam which allows positioning the target barcode within its field of view and thus makes decoding easier.

Normal (default): The engine projects an aiming beam only during barcode scanning/capture.

Always ON: Aiming beam is constantly ON after the engine is powered on.

OFF: Aiming beam is OFF all the time.

4. Notification Beeps

4.1 Mute Mode

Scanning the Enable Mute Mode can turn off all notification beeps. By default, mute mode is disabled.

4.2 Good Read Beep

Scanning the Good Read Beep Off can turn off good read beeps. Scanning the Good Read Beep On, the good read beeps will be restored.

4.2.1 Good Read Beep Frequency

4.2.2 Good Read Beep Duration

4.3 Good Read LED

4.4 Decode Result Notification

When enabled, if a barcode does not decode, “F” is transmitted; if a barcode is decoded, “S” is appended to the barcode data as the most left character.

Note: This function is invalid under the USB DATAPIPE MODE.

Enable Decode Result Notification

Disable Decode Result Notification

5. Data Formatting

In many applications, barcode data needs to be edited and distinguished from one another.

Usually AIM ID and Code ID can be used as identifiers, but in some special cases terminating character suffix like Carriage Return or Line Feed can also be the alternative.

The engine can be configured to transmit barcode data in the following format:

[“F”/ “S”] + [Code ID] + [AIM ID] + [DATA] + [terminating character]

Barcode’s data must be transmitted while others are optional parts.

5.1 AIM ID Prefix

AIM (Automatic Identification Manufacturers) IDs define symbology identifiers and data carrier identifiers. For the details, see Appendix B: AIM ID Table. If AIM ID prefix is enabled, the engine will add the symbology identifier before the scanned data after decoding.

5.2 CODE ID Prefix

Code ID can also be used to identify barcode type. For more information, refer to Appendix C: Code ID Table

User can choose to transmit original CODE ID or visible CODE ID by scanning the appropriate barcode below. Refer to Appendix C: Code ID Table.

5.3 Terminating Character Suffix

A terminating character such as carriage return (CR) or carriage return/line feed pair (CRLF) or horizontal tab (TAB) can be used to mark the end of data.

Disable Terminating Character Suffix

6. Symbologies

6.1 Global Settings

6.1.1 Enable/Disable All Symbologies

If all symbologies are disabled, the engine can only identify programming barcodes.

Enable All Symbologies

WFFD981

Disable All Symbologies

WFFD982

6.1.2 Enable/Disable 1D Symbologies

Scanning the following code set, only for all one-dimensional bar code type unified operation, or allow all reading, or total ban on reading.

Enable 1D Symbologies

WFFD983

Disable 1D Symbologies

WFFD984

6.1.3 Enable/Disable 2D Symbologies

Scanning the following code set, only for all two-dimensional bar code type unified operation, or allow all reading, or total ban on reading.

Enable 2D Symbologies

WFFD985

Disable 2D Symbologies

WFFD986

6.1.4 Video Reverse

Regular barcode: Dark image on a bright background.

Inverse barcode: Bright image on a dark background.

The examples of regular barcode and inverse barcode are shown below.

Regular barcode

Inverse barcode

Video Reverse ON: Read both regular barcodes and inverse barcodes.

Video Reverse OFF (default): Read regular barcodes only.

The engine shows a slight decrease in scanning speed when Video Reverse is ON.

Video Reverse ON

Video Reverse OFF

6.2 1D Symbolologies

6.2.1 Code 128

6.2.1.1 Restore Factory Defaults

Restore the Factory Defaults of Code 128

6.2.1.2 Enable/Disable Code 128

Enable Code 128

Disable Code 128

6.2.1.3 UCC/EAN-128 (GS1-128)

Restore the Factory Defaults of UCC/EAN-128

WFFD991

Enable UCC/EAN-128

W011701

Disable UCC/EAN-128

W011700

6.2.1.4 AIM 128

Restore the Factory Defaults of AIM 128

WFFD992

Enable AIM 128

W101610

Disable AIM 128

W101600

6.2.2 EAN-8

6.2.2.1 Restore Factory Defaults

Restore the Factory Defaults of EAN-8

WFFD994

6.2.2.2 Enable/Disable EAN-8

Enable EAN-8

W011301

Disable EAN-8

W011300

6.2.2.3 Transmit Check Digit

EAN-8 is 8 digits in length with the last one as its check digit used to verify the integrity of the data.

Transmit EAN-8 Check Digit

Do Not Transmit EAN-8 Check Digit

6.2.2.4 Extending Code

An EAN-8 barcode can be augmented with a two-digit or five-digit extending code to form a new one. Examples as below, the part surrounded by blue dotted line is an EAN-8 barcode while the part circled by red dotted line is add-on code.

Enable 2-Digit Extending Code

Disable 2-Digit Extending Code

Enable 5-Digit Extending Code

Disable 5-Digit Extending Code

Enable 2-Digit Extending Code/ Enable 5-Digit Extending Code: The engine decodes a mix of EAN-8 barcodes with and without 2-digit/5-digit extending codes.

Disable 2-Digit Add-On Code/ Disable 5-Digit Add-On Code: The engine decodes EAN-8 and ignores the add-on code when presented with an EAN-8 plus add-on barcode. It can also decode EAN-8 barcodes without add-on codes.

6.2.2.5 Extending Code Required

EAN-8 Extending Code Required

W081308

EAN-8 Extending Code Not Required

W081300

6.2.2.6 EAN-8 EXTEND TO EAN-13

EAN-8 extend to EAN 13 means add five leading zeros to decoded EAN-8 barcodes to extend to 13 digits.

7.4 Appendix D: Parameter Programming Examples

The following examples show you how to program parameters by scanning programming barcodes.

7.4.1 Program the Decode Session Timeout

Example: Set the decode session timeout to 5.0s

1. Scan the Decode Session Timeout barcode.
2. Scan the numeric barcodes “5” and “0”.
3. Scan the Save barcode.

7.4.2 Program the Timeout between Decodes

Example: Set the timeout between decodes to 5.0s

1. Scan the Timeout between Decodes barcode.
2. Scan the numeric barcodes “5” and “0”.
3. Scan the Save barcode.

7.4.3 Program the Image Stabilization Timeout

Example: Set the image stabilization timeout to 5.0s

1. Scan the Image Stabilization Timeout barcode.
2. Scan the numeric barcodes “5” and “0”.

3. Scan the Save barcode.

7.4.4 Program the Sensitivity Level

Example: Set the sensitivity level to 5

1. Scan the Custom Sensitivity barcode.
2. Scan the numeric barcode “5”.
3. Scan the Save barcode.

7.5 Appendix E: Digit Barcodes

0~5

6~9

A~F

7.6 Appendix F: Save/Cancel Barcodes

After reading numeric barcode(s), you need to scan the Save barcode to save the data. If you scan the wrong digit(s), you can either scan the Cancel the Last Digit barcode and then the correct digit, or scan the Cancel All Digits barcode and then the digits you want.

For instance, after reading the Decode Session Timeout barcode and numeric barcodes “1”, “2” and “3”, you scan:

Cancel the Last Digit: The last digit “3” will be removed.

Cancel All Digits: All digits “123” will be removed.
